Notes: 1) For a relay to work normally, the application of rated voltage to the coil is needed.

2) When user's requirements can't be found in the above table, special order allowed.

3) In case 5V of transistor drive circuit, it is recommended to use 4.5V type relay, and 3V to use 2.4V type relay.

Notice

- 1) This relay is highly sensitive polarized relay, if correct polarity is not applied to the coil terminals, the relay does not operate properly.
- 2) To avoid using relays under strong magnetic field which will change the parameters of relays such as pick-up voltage and drop-out voltage.
- 3) Relay is on the "reset" status when being released from stock, with the consideration of shock risen from transit and relay mounting, it should be changed to the "set" status when application(connecting to the power supply). Please reset the relay to "set" or "reset" status on request.
- 4) In order to maintain the "set" or "reset" status, energized voltage to coil should reach the rated voltage, impulse width should be more than 5 times of "set" or "reset" time.
- 5) The relay may be damaged because of falling or when shocking conditions exceed the requirement.
- 6) Regarding the plastic sealed relay, we should leave it cooling naturally until below 40°C after welding, then clean it and deal with coating, remarkably the temperature of solvents should also be controlled below 40°C. Please avoid cleaning the relay by ultrasonic, avoid using the solvents like gasoline, Freon, and so on, which would affect the configuration of relay or influence the environment.
- 7) About preferable condition of operation, storage and transportation, please refer to "Explanation to terminology and guidelines of relay".
