#### Note:

1. The load shouldn't be less than 10%, and the output external capacitor should not be too large (recommend <10µF), otherwise ripple will increase dramatically.
2. Operation under 10% load will not damage the converter; However, they may not meet all specification listed
3. All specifications measured at Ta=25°C, humidity<75%, nominal input voltage and rated output load unless otherwise specified.
4. In this datasheet, all the test methods of indications are based on corporate

Note: "GND" Pin can not vacant, or it will damage the module.

## Typical characteristics

figure 1

## Typical application circuit

- Note:
1. The regulator proposed to establish the input voltage by soft-start, no plug and play, if the input voltage changes from low voltage to high voltage abruptly, the regulator might be damaged.
  2. If the applications is high-voltage input, the regulator must add an external capacitor C1( $\leq 47\mu\text{F}/100\text{V}$ ),to prevent voltage spikes caused by damage to the module.
  3. No parallel connection.

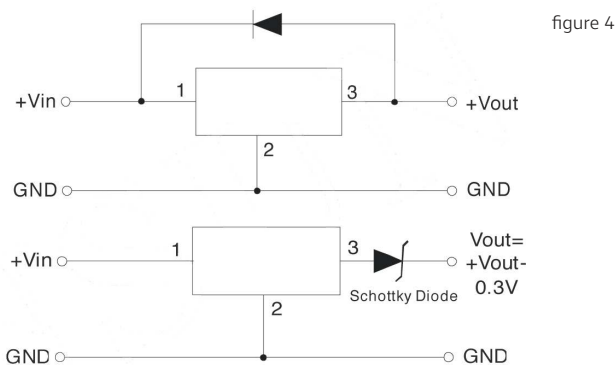

## Application example

High voltage input, multiple outputs, with greater load (figure 3)

- Note:
1. The input current amount of the back-grade regulator and the pre-class load should be less than or equal the max load current of the pre-class regulator.
  2. If further filtering is required, please add components as per the above circuit (We recommend not to add components), if request, please make sure the capacitors C1  $\leq 47\mu\text{F}$ , C2  $\leq 10\mu\text{F}$  more close to the back-grade regulator.
